Art Unit: 3611

1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

2. Claims 1-7 are rejected under 35 U.S.C. 103(a) as being unpatentable over Wand (4,800,974) in view of Takatsuka (USPN 6,902,028).

Wand shows a power steering system with a motor driving means 35, and an integrated circuit 264 that monitors current through a motor and temperature of the circuit, and a control circuit to prevent overheating of the drive circuit. The integrated circuit includes a motor current detecting means an amplifier 586 that amplifies current through a shunt resistor 514, which indicates a value for motor current (see col. 20, lines 49-69). A temperature detecting means 570 is mounted within the same circuit package 264 and indicates temperature at the current detection means. A correction means adjusts output in response to temperature detected, but it does not specifically correct current detection.

Takatsuka teaches a power steering system with a motor driving means 77, a motor current detecting means 78, a temperature detecting means 75 and a correction means for correcting motor current output data on the basis of output from the temperature detecting means. Current output correction based on temperature is described in column 7, line 64 through column 8, line 22. Also, as seen in Figure 3, a correction factor from 109 that is, dependent on detected temperature from temperature sensor 103, is used to modify the current output value  $I_{m1}$  based on temperature.

It would have been obvious to one of ordinary skill in the art to provide data manipulation including modifying the current output in response to detected temperature, as taught by Takatsuka, in order to fine tune the control system. It would also have been obvious to store characteristic data on a data-rewritable, non-volatile memory, in order to effectively store data so it may be modified as necessary.

3. Applicant's arguments with respect to claims 1-7 have been considered but are moot in view of the new ground(s) of rejection.

4. Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire **THREE MONTHS** from the mailing date of this action. In the event a first reply is filed within **TWO MONTHS** of the mailing date of this final action and the advisory action is not mailed until after the end of the **THREE-MONTH** shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than **SIX MONTHS** from the date of this final action.
